CLIENT-SAFE PDF / ANONYMIZED APP-DERIVED EXCERPT

Public-domain evidence - client-safe excerpt

ANONYMIZED APP-DERIVED EXCERPT - Selected and edited from an existing assessment. Identifiers and private values are removed. This is not an unmodified report, a complete assessment or a customer-results claim.

Origin and edition

First-party test assessment. Authenticated exports of existing stored assessments from the current SCOUTz app. No new scan was run for this sample review.

Abridged and edited from the app's domain operator Executive Summary. This is not the original client-output edition.

Observed October 7, 2026 / Display alias: example.com

example.com is a reserved display alias replacing the reviewed domain. These observations were not collected from example.com. No replacement application, user or DNS values are invented.

Scope and coverage limits

Selected outside-in observations from public records and supported web-response evidence. Nothing inside the business was accessed. A public observation does not establish internal controls, ownership, compromise or a complete security condition.

Source: Domain operator Executive Summary, p. 1 / Observed October 7, 2026

The report states that the listed checks were read while full collector reads remained incomplete or unconfirmed. Retained records and individual reads do not establish complete collector coverage.

Readable listed checks are not proof that every expected collector completed or that the entire environment was assessed.

An observation is not a complete security verdict or blanket legal clearance. Agree authorized work and verification before making a change.

Selected public observations

Selected first-party test evidence. Source, date and limits stay with each observation.

Website-icon match to review

Domain operator Executive Summary, p. 2 / Observed October 7, 2026

Perimeter Watch - retained public scan data

Observed evidence: Public scan records show another host with a matching website-icon hash.

Uncertainty and limits: This does not prove ownership or impersonation. Shared icons, templates and hash collisions can produce matches. The underlying icon bytes were not compared.

Possible consequence: A match may justify an asset-inventory or brand-use review; it is not a confirmed copied site or attack.

Proposed next check: Confirm ownership using the asset inventory and independent evidence. Establish evidence of impersonation before requesting a takedown.

Browser content rules need review

Domain operator Executive Summary, p. 7 / Observed October 7, 2026

TLS Check - public web-response observation

Observed evidence: The report records Content-Security-Policy as not set.

Uncertainty and limits: An absent response header is not proof that an attack occurred or that all web routes have the same configuration.

Possible consequence: The intended browser-content restrictions need confirmation for the relevant site and response.

Proposed next check: Review the relevant response and intended browser policy with the website owner. Scope, test and verify any approved change.

Keep the decision attached to evidence

Lookalike domain observation

Domain operator Executive Summary, p. 8 / Observed October 7, 2026

Twin Trace - public domain observation

Observed evidence: Domain names that look like the reviewed domain were observed.

Uncertainty and limits: A similar name does not establish ownership, impersonation, active phishing or ongoing monitoring.

Possible consequence: The observation may warrant a bounded brand-use check, not an accusation or an automatic takedown.

Proposed next check: Confirm the relevant domain and its actual use with independent evidence before deciding whether action is justified.

Agree the work before changing anything

Review the methodology and sample limitations, then compare pricing and apply for the open beta if this supports your MSP workflow.

Observed finding -> Possible consequence -> Customer question -> Authorized next check. SCOUTz prepares the conversation; the MSP owns the relationship and recommendation.

Source and edition record

All selected observations above come from the existing domain operator Executive Summary. The excerpt preserves its incomplete or unconfirmed collector-read qualification. Raw records and private identifiers are not included.

This client-safe adaptation was prepared from the operator report; it is not a downloaded original app client-output edition.

No new scan was run. Selected evidence is not a customer outcome, a security rating or a complete assessment.
