MSP OPERATOR PDF / ANONYMIZED APP-DERIVED EXCERPT

Public-domain evidence - operator excerpt

ANONYMIZED APP-DERIVED EXCERPT - Selected and edited from an existing assessment. Identifiers and private values are removed. This is not an unmodified report, a complete assessment or a customer-results claim.

Origin and edition

First-party test assessment. Authenticated exports of existing stored assessments from the current SCOUTz app. No new scan was run for this sample review.

Selected and edited from the app's domain operator Executive Summary. Private raw evidence, identifiers, service estimates and pricing are omitted.

Observed October 7, 2026 / Display alias: example.com

example.com is a reserved display alias replacing the reviewed domain. These observations were not collected from example.com. No replacement application, user or DNS values are invented.

Scope and coverage limits

Source attribution and investigation choices for selected public-domain observations. This excerpt is not a complete collector ledger or a substitute for the private operator record.

Source: Domain operator Executive Summary, p. 1 / Observed October 7, 2026

The listed checks were readable, but full collector reads remained incomplete or unconfirmed. Coverage notices and individual reads do not establish complete collector coverage.

An observation is not a complete security verdict or blanket legal clearance. Agree authorized work and verification before making a change.

Selected public observations

Selected first-party test evidence. Source, date and limits stay with each observation.

Website-icon match to review

Domain operator Executive Summary, p. 2 / Observed October 7, 2026

Perimeter Watch - Shodan retained public scan records

Observed evidence: A retained public scan record contains a website-icon hash matching the reviewed domain's recorded hash.

Uncertainty and limits: The underlying icon bytes were not compared. Shared icons, templates and hash collisions can produce a match. Ownership and impersonation are not established.

Proposed next check: Cross-check the asset inventory and independent evidence. Confirm ownership and purpose if related; otherwise establish actual brand misuse before escalation.

Content-Security-Policy response observation

Domain operator Executive Summary, p. 7 / Observed October 7, 2026

TLS Check - public web-response observation

Observed evidence: The operator report lists Content-Security-Policy as not set.

Uncertainty and limits: The excerpt contains no raw response or proof that every route has the same policy. It does not establish exploitation.

Proposed next check: Validate the relevant response, intended policy and affected routes. Stage an approved change with test and rollback criteria, then verify the observable response.

Keep the decision attached to evidence

Published mail-authentication policy

Domain operator Executive Summary, p. 8 / Observed October 7, 2026

Email-authentication check - published DNS policy

Observed evidence: The report records an enforcement-requesting DMARC policy and a strict SPF policy as present.

Uncertainty and limits: Published policy intent does not prove that every receiver acted on it, every sender aligned or a particular message was delivered or rejected. Actual message delivery was not tested.

Proposed next check: Confirm approved sending sources, alignment, reporting ownership and intended policy. Use separately authorized message or aggregate-report evidence where the question requires it.

Agree the work before changing anything

Return to the private operator record for the actual identifiers and raw evidence. Agree authorized work, ownership and verification before making a change.

Observed finding -> Possible consequence -> Customer question -> Authorized next check. SCOUTz prepares the conversation; the MSP owns the relationship and recommendation.

Source and edition record

All selected observations above come from the existing domain operator Executive Summary. The excerpt preserves its incomplete or unconfirmed collector-read qualification. Raw records and private identifiers are not included.

No new scan was run. Selected evidence is not a customer outcome, a security rating or a complete assessment.
